

Heart Disease Prevention **PREDICT, PREVENT & REVERSE A BLOCKAGE!**

Schedule a Consultation Today!

www.NextHealthMed.com • 703-724-4000

Introduction

The #1 killer for men and women, even those with cancer, is a heart attack. Any cause of inflammation (such as lupus, Crohn's disease, ulcerative colitis or rheumatoid arthritis) all increase the risk of heart attacks. Therefore a thorough evaluation of the whole body is required.

Did You Know?

Stress tests alone are not adequate to detect a problem as they're only indicative of a major blockage. At Next Health we go above and beyond with a comprehensive program that is able to predict, prevent and reverse a blockage before it becomes an issue.

The Next Health Solution

1: Evaluate risk. 2: Make targeted lifestyle changes.
3: Reverse or prevent disease (Diabetics see a 40% reduction in heart disease following IV chelation, according to TACT I trial, NIH).

- Advanced cardiac labs
- Micronutrient testing
- Routine labs with additions such as HSCRP, insulin resistance and homocysteine.

Supplementation: Next Performance, Next Buffered C, Next Omega and Next Cardio.

How is Our Program Different?

We utilize advanced technologies to diagnose disease years in advance...

- We look at cardiovascular risk in 3D, analyzing what's inside the vessel and its lining, as well as what's outside.
- Our state-of-the-art technologies allows us to identify inflammation (the #1 risk), molecular size, oxidation and insulin resistance.

Benefits

- Less inflammation
- Improved blood flow and performance
- Increased vitality and health
- Longer life expectancy
- Increases blood circulation
- Detoxes the body of poisonous side effects of medical treatments such as chemotherapy.

Conditions That Should Raise Concern

- Chronic fatigue
- Feeling unhealthy overall
- Overweight or obese
- Weak erections
- Shortness of breath
- Family history of heart disease, diabetes, stroke, pre-diabetes, obesity.
