Overview

An intravenous infusion of a large amount of vitamin C mixed in saline, administered over 30-45 minutes along with B vitamins.

Benefits

- Enhances our immune system's ability to combat bacterial and viral infections.
- Fast repair of wounds and injuries.
- Doses greater than 25 grams have been shown to alter electrons on cell membranes, which allows optimal entry of your white blood cells in fighting and preventing things like strep, cellulitis and post-surgical infections.
- Can eliminate a wide range of toxins, and even has a mild chelating effect on the removal of toxic heavy metals, such as cobalt and chromium.
- Has an antihistamine effect, which is useful in fighting allergies. When we lack vitamin C we are prone to an increase in inflammation, asthma attacks and allergic reactions.

- Essential for the synthesis of collagen, the main structural protein found in connective tissue. This collagen stimulating effect can also assist the body with walling off malignant tumors.
- The B vitamins help in boosting energy and metabolism, and alleviate symptoms of fatigue.
- Improves the immune system and helps with the common cold, especially in individuals with a poor digestive function.
- Helps with iron absorption.
- Helps athletes gain an advantage in performance and recovery.

How is it Performed?

- The vitamin mixture is injected through a vein into the bloodstream.
- Common side effects, if any, include minor discomfort in the arm. You can minimize your symptoms by coming well hydrated. We'll apply a hot towel and/or heating pad for your comfort.
